

EXPLANATION FOR DEBUGGING:

1. Create an Optimized Searchbar, it should be able to accept descriptive texts and properties of items, e.g. Toner, Whitening and it will suggest search items that are similar to the customer's search.

SOLUTION:

We created another column inside the order table in the database with the name "description," then we added a text area in the code inside the admin_product.php so that we can easily label or give tags to our products, and then we added to their function part so that it will work perfectly. The outcome is that when you search for a specific or random label or tag, like, for example, lipstick, it will show the product that are similar to the customer's search.

2. Replace the Delete button with deactivate/activated items or archive button.

SOLUTION:

The first thing I did was add an archive column to the orders table database so that the archived data would be stored there. After that, I start creating an admin_archive.php type code for the archive and start connecting it with the admin_product.php codes so that every placed order that I decide to put in the archive will be directed to the archived page.
